Node  $N_i$ , Node  $N_j$ , Each Node is illustrated in Fig. 1.

Sending Stream of Data from  $N_i$  to  $N_j$

String of Bits Sent in A "Framed" fashion.

Note: Consider the Construction of Each frame, frame  $i$ ,  $i=1, 2, \dots, N$ .

What are the Contents to be placed into A Frame?

Like start bit(s)  $\rightarrow$  to Mark the Beginning of the Communication.  
 $\rightarrow$  Timing/Sync.

C.R. (Cognitive Radio), SDR (Software Defined Radio)

multiple Bits in Sync. Design  $\rightarrow$  more Reliable  $\rightarrow$  "Robust" performance  
Maybe

Question: What is the general guideline in terms of designing "Sync" Field?

The Objective for R.F. Board Framework/Design: To Allow  $N_i, M_j$  to Sync.

multiple Bits of what?

3 bits Example:  $2^3 = 8$

b2	b1	b0
0	0	0
0	0	1
0	1	0
0	1	1
1	0	0
1	0	1
1	1	0
1	1	1

Transition  $\rightarrow$  Change of State

"Zero Crossing"  $\rightarrow$

For Example "1"  $\rightarrow$  "0" OR

To provide best possible "Transitions", e.g. "Z.C."

Pick 0x5 Binary: 101

2-Step Approach:

Step 1. Based on Land Line;  
Step 2. then R.F. (Wireless)

Hence, R.F. Board will have to Support 2 Options.

4. Testing Circuit

Output Testing	Output "1" from the Host/Embedd System
